Define the Problem Statements

Customer Problem Statement Template

Date	31 January 2026	**Team ID**	
Project Name	F1 Racing Analytics	**Maximum Marks**	2 Marks

Problem framing: F1 data spans driver points, team performance, race outcomes, tyre compounds, country participation and podiums. The project brings these views into one interactive experience.

Statement	Customer	I am / I'm	I'm trying to	But	Because	Which makes me feel
PS-1	F1 fan / follower	I follow drivers and teams across seasons.	Compare driver points and team performance and identify leaders quickly.	Information can be spread across different views and hard to compare at a glance.	Standings, season results and supporting statistics are not always together in one clear view.	Frustrated when comparison takes too long; confident when the leaderboard is clear.
PS-2	Motorsport data enthusiast	I explore race outcomes and performance patterns.	Understand how tyre compounds, podiums, DNF reasons and country participation relate to F1 history.	Individual charts may not explain the overall pattern or let me focus on details I need.	The data has several dimensions and needs clear visualisation, labels and useful filtering.	Curious when charts are readable and interactive; confused when views are crowded or keep loading.

How the project responds

F1 Racing Analytics provides a consolidated Tableau dashboard with KPI cards and views for driver points, team rankings, team championship by season, tyre compound analysis, country-wise participation, podium analysis and DNF reasons. A driver leaderboard story uses a Top N filter to focus on a chosen number of drivers.

Validation note: These statements are drafted from the project scope and intended use. Refine them after feedback from actual F1 viewers or dashboard users.
