PROJECT DOCUMENTATION

Problem–Solution Fit

Completed project-fit analysis organised by the ten sections in the supplied canvas

Date	15 March 2026	**Team ID**	
Project Name	F1 Racing Analytics	**Maximum Marks**	As per template

Purpose / Vision

Make Formula 1 performance easier to explore by turning structured race records into a clear, interactive dashboard and driver leaderboard story.

Canvas Section	F1 Racing Analytics — project-specific content
1. Customer Segment(s)	Formula 1 fans, students learning business intelligence, motorsport enthusiasts, and viewers who want to compare drivers, teams, seasons and race patterns.
2. Jobs-to-be-Done / Problems	Bring multiple F1 performance measures into one place; compare driver points and team performance; inspect race outcomes, DNF reasons, tyre compounds, podiums and country participation without manually reading raw files.
3. Triggers	Interest in a season or driver comparison; preparing a class or project presentation; wanting evidence to support a discussion about team/driver performance; exploring trends across seasons.
4. Emotions: Before / After	Before: curiosity mixed with difficulty finding a single view across multiple data fields. After: greater clarity and confidence when the charts, labels and filters make comparisons easy. These are expected user reactions, not results from a formal study.
5. Available Solutions	Reading raw CSV/text files, checking individual statistics pages, using static tables or charts, or viewing separate dashboards. These options can require switching sources and may not provide the same project-specific combination of views.
6. Customer Constraints	Users may have limited time or data-analysis experience; they need internet access for embedded Tableau Public views; small screens and slow loading can make detailed charts harder to use; available insight is limited to the fields in the supplied dataset.
7. Behaviour	Visitors open the website, read the overview, move to the dashboard, inspect KPI cards and charts, and open the driver leaderboard story. Interested users adjust the Top N control and compare drivers.
8. Channels of Behaviour — Online	Bootstrap website pages, navigation links, embedded Tableau Public dashboard and story, chart tooltips and Tableau filter/parameter controls where available.
8. Channels of Behaviour — Offline	Classroom or project demonstrations, presentations, peer discussions and instructor reviews using the website on a laptop or display.
9. Problem Root Cause	The underlying records are structured data rather than a ready-to-read narrative; insights are distributed across multiple fields and measures; users need aggregation, comparison and visual context to interpret patterns.
10. Your Solution	A responsive F1 Racing Analytics website with a Tableau Public dashboard and a driver-points story. It presents competing teams, seasons, race outcomes, circuits, team/championship performance, tyre compounds, country participation, podium analysis and a Top N driver leaderboard.

Fit hypothesis

If F1 performance measures are presented through clearly labelled, responsive visualisations and an easy-to-find driver story, visitors will be able to compare patterns more efficiently than by inspecting raw files alone.

Scope note: Customer segments, triggers, behaviours and emotions are reasonable project assumptions based on the intended audience and website workflow; they have not been validated through customer interviews or usability testing.
