## Purpose and design approach

The F1 Racing Analytics dashboard brings key Formula 1 participation and performance views together in one place. It is designed to let viewers move from a high-level overview to more detailed comparisons of drivers, teams, race outcomes, tyre strategies, countries and podium finishes.

## Design principles used

- **Clear and intuitive layout:** overview KPI cards appear first, followed by comparative charts and specialist analysis.
- **Appropriate visualisations:** KPI cards summarise totals; horizontal bars compare drivers and teams; a season-by-team bar view shows championship points; a map presents country participation; a packed-bubble view compares podium finishes; and a pie chart summarises tyre-compound strategies.
- **Colour and theming:** restrained blue/teal dashboard styling with differentiated chart colours helps separate categories.
- **Interactive exploration:** Tableau filters and the Top N parameter support focused exploration where available in the published views.
- **Responsive presentation:** the dashboard is embedded on a Bootstrap website; the web layout should allow the Tableau view to resize without overlapping surrounding page content.

## Major outcomes visible in the dashboard

- **Competing teams:** the overview KPI displays 10 teams.
- **Seasons in play:** the overview KPI displays 17 seasons.
- **Race outcomes logged:** the overview KPI displays 6,464 records.
- **Circuits showcased:** the overview KPI displays 29 circuits.
- **Driver points comparison:** the leaderboard highlights the highest-point drivers in the dataset; the visible example includes Max Verstappen and Lewis Hamilton among the leading totals.
- **Team performance:** the ranking view compares cumulative points across teams, while the championship analysis breaks points down by team and season.
- **Additional perspectives:** DNF reasons, tyre compounds, country-wise participation and podium finishes provide complementary views of reliability, strategy and participation.
