STORY DESIGN

F1 Racing Analytics | Driver Points Leaderboard Story

Date	22 October 2026
Team ID	
Project Name	F1 Racing Analytics
Maximum Marks	5 Marks

Purpose of a Tableau story

A Tableau story presents visualisations and supporting text in a sequence so viewers can follow the analysis and understand the main findings. This project uses a focused driver-points leaderboard story to communicate a simple comparison rather than repeating every chart from the full dashboard.

Story narrative: Driver Points Leaderboard

Story point 1 — Compare driver points. The horizontal bar chart ranks drivers by total points, making it easy to compare the leading drivers in the dataset.

Story point 2 — Focus the view with Top N. The Top N control lets the viewer choose how many leading drivers to display. A smaller value creates a concise leaderboard; a larger value expands the comparison. The selected value should be checked in the published story to confirm the expected number of drivers is displayed.

Story point 3 — Interpret the result. Use the bar lengths and point labels to compare the selected drivers. The view supports a quick reading of the points gap between drivers without requiring the audience to inspect the full dataset.

Observations

- The leaderboard is a driver-level comparison based on points.
- The Top N parameter is the main interaction for narrowing or expanding the leaderboard.
- Horizontal bars and direct point labels make relative performance easier to read.
- This story is intended as a compact companion to the full F1 Racing Analytics dashboard.
